

Move the two floating action buttons — the Help button (blue circle with ?) and the AI Assistant button (purple circle with sparkle icon) — OUT of the floating position and INTO the top navigation bar. They are currently floating over page content and covering up important information, especially on mobile. This is the fix.

WHAT TO DO

1. **Remove both floating buttons entirely.** Delete the fixed-position floating circles from the bottom of the screen. They should no longer exist as floating elements on ANY screen size (mobile, tablet, desktop).
2. **Add them as icons in the top nav bar.** Place them in the right side of the existing top header bar (where the user avatar/initials already sits). They should appear as simple icon buttons — no background circles, no shadows, just clean icons that match the header style. Layout should be:

```
[PCB Auto Logo — Demo Auto Shop] ..... [? icon] [★ AI icon] [JS  
avatar]
```

- Help icon: question mark or help-circle icon (use the same icon library already in the project — likely Lucide, Herolcons, or similar)
 - AI Assistant icon: sparkles/stars icon (matching current branding)
 - Keep them subtle — same color as other header elements, not bright blue/purple
 - Size: 20-24px icons, with 36-40px tap targets for mobile accessibility
3. **Tapping them opens the same panels they currently open.** The Help button opens the help panel/modal. The AI Assistant button opens the AI chat panel. No behavior change — just a different trigger location.
 4. **On mobile:** The top bar may be tighter. If there's not enough room, you can:
 - Use slightly smaller icons (18-20px)
 - Or combine them into a single "support" icon that opens a small menu with both options
 - But ideally both fit — two small icons don't take much space
 5. **On desktop/tablet:** Plenty of room in the header. Just place them naturally before the user avatar.

ALSO CLEAN UP

- Remove any CSS related to the floating button positioning (fixed, z-index, bottom offsets, etc.)
- Remove any scroll-based show/hide logic if it was added for the floating buttons
- Remove any drag/minimize functionality if it exists
- Make sure the AI chat panel and Help panel still open correctly from their new trigger location
- The panels should still slide in from the bottom on mobile and appear as a side panel or modal on desktop — same as before, just triggered from the header instead

WHY THIS IS BETTER

- Zero content obstruction on any screen size
- No overlap with the mobile bottom navigation bar
- Consistent with standard SaaS app patterns (Slack, Notion, etc. put help in the header)
- Cleaner UI, less clutter, more professional
- No complex minimize/drag/fade logic needed
